## Midterm 2 review

- (1) Ch5 Sampling schemes and accuracy (by accuracy, i mean local truncation error  $\tau^n$  and one-step error  $\mathcal{L}^n$ ).
- (2) Ch6 zero stability
  - especially useful for linear multistep methods.
  - given  $u' = f(u, t)$ , test the scheme with  $f(u, t) = 0$ .
  -

## Zero stability

- (1) if all roots of the characteristic polynomial are less than 1, scheme is zero-stable
- (2)
